

LGS DEVICEFARM

REMOTE CONTROL OF PHYSICAL MOBILE DEVICES

For cybersecurity labs that need to model, simulate, test, and analyze mobile applications before deploying them in their production networks, there's always been one big problem: how can you replicate realistic application behavior in a secure, controlled-access environment?

The LGS DeviceFarm solves this problem by bundling all the components necessary to host your own mobile device bank in a pre-packaged, plug-and-play solution that can physically be deployed in any facility —enabling remote management and automated testing of multiple devices from a single web interface. So instead of offering mobile app testing as a service, LGS hardware and software allows our customers to easily deploy their own local device farm.

MODEL, SIMULATE, AND TEST MULTIPLE DEVICES FROM ONE WEB INTERFACE

Just like commercially available device banks, LGS DeviceFarm allows cyber labs and mod/sim personnel to test new and upgraded apps on dozens of combinations of devices and operating systems. Users can interact and control device arrays remotely via a single web interface and apply record/replay features to automate testing of mobile devices and applications.

Unlike rent-a-device approaches, the LGS DeviceFarm solution allows for secure control of the mobile devices, limiting physical access to those within your data center and testing teams.

Additional applications of the LGS DeviceFarm include application automation, autonomous app navigation, mobile traffic generation, and network and application security analysis.

Remote Control: Remotely interact with multiple physical mobile handsets through a single web browser interface using mouse clicks and drags or touch and swipes.

App Automation: Create, save, and replay sequences of touch and swipe actions. Leverage our intelligent app crawler to autonomously navigate through your mobile application(s).

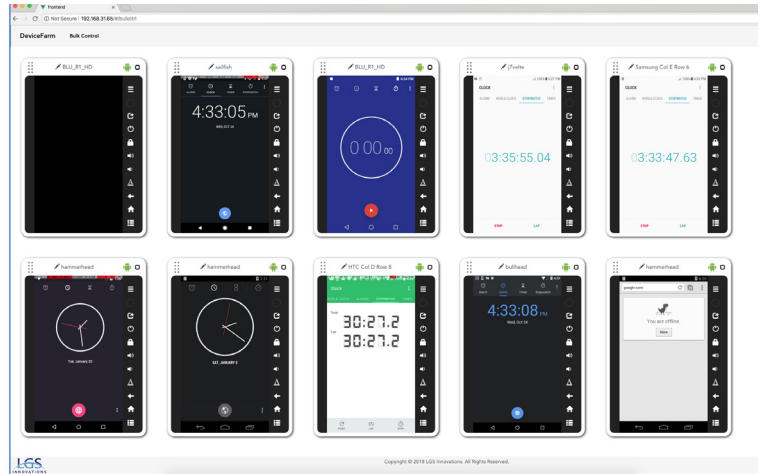

Traffic Generation: Generate realistic traffic simultaneously from multiple physical mobile devices of varying makes, models, and operating system versions.

Traffic Analysis: Perform mobile network and application security analysis through the collection, inspection, modification, and injection of client and server network traffic.

LGS DeviceFarm has a unique bulk control interface designed for controlling multiple mobile devices within a single view. Observing the behavior and performance of a mobile app in conjunction with other apps and devices in real-time can more effectively demonstrate the impact of mobile application activities and capabilities.

LGS DEVICE FARM USERS ENJOY REMOTE INTERACTION WITH AND CONTROL OF DEVICE ARRAYS VIA A SINGLE WEB INTERFACE

LGS DEVICEFARM FORM FACTORS

LGS DeviceFarm solution can be software only but is also available in a variety of form factors. These form factors bundle remote control, management, storage, and recharging of multiple mobile devices into a pre-packaged, plug-in-play solution. The DeviceMini and DeviceCube are highly compact, portable desktop versions that can manage and store several devices. As you begin to scale up, the DeviceStadium is a rack mountable enclosure that can house up to 44 mobile devices, 8 of which can be stored in DeviceRack. The chart below illustrates the capacities of each form factor.

	DEVICEFARM SW	DEVICEMINI	DEVICECUBE	DEVICESTADIUM	DEVICERACK
DEVICE CAPACITY	4	8	16	44	352

ABOUT LGS INNOVATIONS

LGS Innovations is a technology company delivering mission-critical communications products, R&D, and supporting services to government and commercial customers worldwide. We create advanced solutions in wireless communications, signals processing and analysis, optical networking, photonics, routing and switching, and spectrum management, driving mission success in C4ISR, cyber-space operations, and network assurance.
